

*When spraying any herbicide, applicators and growers must follow all product labeling and state and local requirements. Herbicides containing the DGA salt of dicamba are restricted for use in the State of Arkansas from April 15 through September 15, per [State approval in January](#). This includes XtendiMax with VaporGrip Technology, and, as a result, Monsanto has not sold dicamba products in the State of Arkansas.*

*Since before the season started, Monsanto has been reminding growers, applicators and dealers that XtendiMax is not approved for in-crop use this season, and it would be illegal to use a pesticide in a state where it is not approved. Monsanto's [Stewardship](#) section at [RoundupReadyXtend.com](#) includes reminders that application of XtendiMax is prohibited until state approvals are gained, and only those states that have approval for in-crop use have been highlighted on the [state approvals map](#). Monsanto does not condone the illegal use of any herbicide.*

*It is critical that applicators read and follow directions for all pesticide product labeling, including following state and local requirements. If growers and applicators have questions on dicamba label compliance, they should check with the Arkansas State Plant Board or Arkansas Department of Agriculture for state and local application requirements.*
